PROJECT Knori

Final Technical Offer — Phase 1–5 (V2)

Architecture • Platform Foundation • Identity Intelligence Development

PREPARED FOR

Knori — Identity Intelligence Platform

PREPARED BY

Noventrix Solutions
Dhaka, Bangladesh — Dubai, UAE — Africa, Nigeria

25th August 2026

CONFIDENTIAL — PREPARED EXCLUSIVELY FOR THE ADDRESSEE

Revision Note

This document supersedes the Final Technical Offer dated 25 August 2026. It incorporates Sway's feedback on the Intellectual Property (IP) ownership language in Section 8 of the original proposal, and reconciles the related Source-Code Access and Portability provisions. No changes have been made to the technical scope, workstreams, or phase timelines of Phases 1–5; the engineering plan is unchanged.

The revisions below reflect agreement in principle with Sway's position: implementation of the Recognition Operating System (“ROS”) by Noventrix does not transfer ownership of ROS to Noventrix. Noventrix's protection is limited to its genuinely pre-existing Background IP and general engineering know-how.

1. Executive Strategy

KnoRI is the first commercial expression of ROS — the Recognition Operating System, owned by Sway. Noventrix's role is to architect and engineer ROS and its first product expression, KnoRI, on Sway's behalf.

Development strategy: Ship narrowly. Architect forward.

The first release must be commercially credible, polished and sellable, while the underlying ROS architecture must be sufficiently disciplined to support progressively deeper Recognition without requiring fundamental reconstruction. This reflects Sway's stated balance between an immediate, purchase-ready product and a long-term platform foundation — and Sway's ownership of that foundation.

2. Phase 1 — Commercial KnoRI Foundation

Objective

Deliver the minimum product Noventrix and Sway/KnoRI are willing to sell. This is not a prototype or technical demonstration — Sway explicitly distinguishes a technical Recognition validation from the commercial Phase 1 product.

Timeline

8–12 weeks

Phase 1 Outcome — a customer can:

- Understand KnoRI without hand-holding
- Onboard
- Communicate naturally
- Establish persistent context
- Receive meaningful Recognitions
- Inspect the basis of a Recognition
- Correct KnoRI
- See the effect of correction
- Return and experience continuity
- Use a stable, polished product
- Purchase the product with confidence

Workstream 1 — Product Foundation

- Authentication
- User profile
- Onboarding
- Account management
- Settings & privacy controls

- Core navigation
- Production-ready UX
- Web/mobile foundation

Workstream 2 — Persistent Context

- Conversation history
- Structured memory
- Context persistence & retrieval
- Relevant-context selection
- Memory organization
- User context profile

Workstream 3 — Recognition Engine v1

Implements the canonical loop that is the foundational ROS Recognition mechanism specified by Sway:

> *Signal → Evidence → Interpretation → Confidence → Threshold → Recognition → Provenance → Correction → Updated Understanding*

Workstream 4 — Recognition Experience

- Recognition presentation
- Evidence display
- Confidence & explanation
- Provenance
- Accept / Correct / Reject / Dismiss
- Recognition history foundation

Workstream 5 — Conversational Experience

- Context-aware conversation
- Memory-aware conversation
- Recognition-aware conversation
- Continuity
- Basic personality/warmth

Important: companionship remains an experience quality, not the product's primary intelligence thesis.

Workstream 6 — ROS Foundation

- Signal / Evidence / Interpretation abstraction
- Confidence model
- Threshold model
- Provenance structure
- Correction mechanism
- Model abstraction

- Memory interface
- AI orchestration layer

Workstream 7 — Production

- API/backend
- Database
- Authentication/security
- Deployment, monitoring & logging
- Error handling
- Backup/recovery
- Documentation & handover

Phase 1 Acceptance

Is this a real product we can put in front of paying customers? Success also requires that Recognition is evidence-grounded, inspectable and correctable — explicitly among Sway's desired Recognition-level measures.

3. Phase 2 — Recognition Intelligence

Objective

Transform Recognition from a basic product capability into the core intelligence differentiator.

Timeline

4–6 weeks

Evidence Intelligence

- Evidence accumulation
- Evidence relevance
- Temporal weighting
- Context weighting
- Evidence strength

Pattern Intelligence

- Repeated, emerging & stable patterns
- Situational patterns
- Pattern strength

Competing Interpretations

Instead of forcing one conclusion, the system retains uncertainty where appropriate:

> *Evidence → Interpretation A / B / C → Confidence → Threshold*

Recognition Thresholds

Introduces stronger discipline around sufficient/insufficient evidence, confidence, uncertainty and recognition suppression. A key objective is for KnoRI to know when not to recognize something — Sway explicitly identifies this as a success criterion.

Contradiction Intelligence

- Conflicting evidence
- Historical vs. recent evidence
- Contextual contradictions
- Confidence adjustment
- Recognition revision

Provenance

> *Recognition → Interpretation → Evidence → Signal → Source/Context*

Phase 2 Result

The product moves from “KnoRI remembers me” to “KnoRI recognized something meaningful about me and can show me why.”

4. Phase 3 — Longitudinal Memory Intelligence

Objective

Make KnoRI's understanding evolve over time. Memory stops being simply a repository and becomes part of an evolving model of the user.

Timeline

6–8 weeks

Evolving Memory

Instead of Fact → Store, KnoRI moves toward:

> *Fact → Context → Evidence → Interpretation → Confidence → Evolution*

Temporal Understanding

- Recent, historical & recurring patterns
- Changing & long-term patterns
- Context-dependent patterns

Recognition Evolution — a Recognition should be able to:

- Emerge, strengthen or weaken
- Change interpretation
- Become uncertain
- Be corrected
- Disappear when no longer supported

Recognition History — shows:

- What was recognized, when, and supporting evidence
- Confidence and user response
- Subsequent evolution

Facets / Review

Introduces deeper user-review structures around recurring patterns and areas of personal context.

Correction Learning

> *Recognition → User Correction → Updated Understanding → Future Recognition*

This directly supports Sway's requirement that correction should affect future reasoning.

Phase 3 Result

The user should feel: “KnoRI understands me better because it has known me longer.” This creates the longitudinal value loop that separates KnoRI from ordinary memory-enabled AI.

5. Phase 4 — Relationship Intelligence 2.0

Objective

Extend Recognition from individual patterns into relationships, interactions and contextual human experience.

Timeline

6–8 weeks

Relationship Graph

> *Person → Interaction → Event → Signal → Evidence → Pattern → Recognition*

Relationship Memory

Maintains longitudinal context regarding significant people and interactions.

Contextual Relationship Recognition

Recognizes patterns without making absolute assumptions. Instead of “You always have communication problems,” the system is capable of: “Across these situations, a similar communication pattern appears, particularly under these conditions” — far more consistent with evidence-based Recognition.

Relationship Patterns

- Communication & interaction consistency
- Boundaries & shared context
- Behavioral changes
- Recurring & contextual differences

Relationship Facets

Introduces structured areas for reviewing relationship patterns.

Neutral Recognition

KnoRI must remain neutral toward positive, neutral and negative patterns. It should not assume pathology or distress.

Phase 4 Result

KnoRI evolves from Self Recognition to Self + Relationship + Contextual Recognition.

Ethical & Liability Boundary — Prerequisite to Scoping Phase 4

Because Phase 4 extends Recognition into relationships, interactions and the behavior of people who are not the account holder, Noventrix requires the following position to be agreed in writing before Phase 4 is scoped or priced:

- Third-party data boundary: Relationship Recognition processes references the user makes to other people, not independently collected data about those people. KnoRI does not identify, profile, or build a persistent record on any individual who is not the account holder.
- Consent basis: The account holder's acceptance of KnoRI's Terms of Service constitutes the sole consent basis for relationship-context processing. No separate consent is sought from, or owed to, third parties referenced in a user's conversation.
- No diagnostic or clinical claims: KnoRI does not generate, label, or imply psychological, medical, or behavioral diagnoses about the user or any third party. Neutral Recognition language is a contractual requirement, not a design preference.
- Sensitive-category exclusion: Relationship Recognition explicitly excludes inference or storage of protected categories (health, mental health, sexual orientation, immigration status, criminal history, and similar) about the user or any third party.
- Data minimization & retention: Relationship-pattern data is retained only as long as needed to support the Recognition it underlies, and is deleted or anonymized on account deletion or explicit user request.
- Liability allocation: Noventrix's responsibility is limited to building Phase 4 to the agreed technical and neutrality specification. Sway/KnoRI, as data controller, is responsible for the product's Terms of Service, privacy policy, end-user consent flows, and any jurisdiction-specific compliance (e.g., GDPR, CCPA) arising from relationship-context features.
- Review gate: Phase 4 acceptance criteria include a joint ethical/liability review checkpoint before the Relationship Graph and Relationship Memory workstreams move into production.

This position is to be captured as a signed addendum or schedule to the Roadmap Agreement — a precondition to scoping Phase 4, not a Phase 4 deliverable.

6. Phase 5 — ROS Platform & AI-Native Scale

Objective

Convert the proven Recognition architecture into a generalizable ROS platform, owned by Sway. ROS = Sway's Recognition architecture/platform. KnoRI = its first consumer expression.

Timeline

8–12+ weeks, depending on the selected expansion scope.

ROS Core — reusable engines/services engineered for Sway

- Signal, Evidence & Context Engines
- Interpretation, Confidence & Threshold Engines
- Recognition & Provenance Engines
- Correction, Memory & Relationship Engines

Model-Agnostic Layer

ROS should be able to work with different foundation models, LLM providers, retrieval systems, memory systems and specialized AI models. Sway specifically wants ROS to remain reasonably model-agnostic.

Platform Expansion

Only at this stage should advanced domain intelligence, predictive intelligence, autonomous actions, external integrations, specialized agents, external data sources and API/SDK capabilities be aggressively introduced. These are explicitly areas Sway considers later rather than necessary for the first commercial release.

Potential ROS Expressions (Sway roadmap opportunities, not Phase 1 commitments)

- ROS → KnoRI
- ROS → Personal Intelligence
- ROS → Relationship Intelligence
- ROS → Enterprise Intelligence
- ROS → Specialized Domain Intelligence

7. Final Roadmap

Phase	Primary Mission	Commercial/Technical Outcome	IP Position
1	SELL	Purchase-quality KnoRI	Sway owns project deliverables
2	RECOGNIZE	Evidence-grounded Recognition	Sway owns project intelligence
3	UNDERSTAND	Longitudinal evolving understanding	Sway owns project-specific evolution
4	RELATE	Relationship/contextual intelligence	Sway owns project-specific architecture
5	SCALE	ROS Recognition platform	Sway owns ROS & project-specific platform; Noventrix retains Background IP

8. Intellectual Property — Revised Ownership Framework

Following review with Sway, Noventrix accepts the following ownership principle. Noventrix does not retain ownership of ROS or the Recognition architecture as a result of implementing or engineering it. Ownership is instead organized around four clearly separated categories:

IP Category	Ownership
Noventrix Background IP	Noventrix
Sway/KnoRI Background IP, including ROS	Sway/Knori
Project-specific KnoRI/ROS Deliverables	Sway/Knori, upon payment
Noventrix General Know-how / Skills	Noventrix (bounded — see §8.3)
Third-party / Open-source IP	Respective third-party license by Knori

8.1 What Belongs to Sway

A. ROS (Recognition Operating System)

- ROS conceptual architecture
- ROS architecture specifications
- Recognition lifecycle, ontology and workflow
- Recognition reasoning framework
- Recognition orchestration logic
- Recognition-specific data structures

B. Recognition Intelligence Models

- Signal model
- Evidence model
- Interpretation model
- Confidence model
- Threshold model
- Recognition model
- Provenance model
- Correction model
- Recognition evolution model

The canonical Recognition loop — Signal → Evidence → Interpretation → Confidence → Threshold → Recognition → Provenance → Correction → Updated Understanding — is treated as part of the Sway/KnoRI-owned Recognition architecture, subject to whatever pre-existing IP Sway can establish.

C. Project Implementation

- Source code specifically created for ROS/KnoRI
- Database schemas
- API specifications
- Workflows and system specifications
- Prompts/instructions specifically created for KnoRI
- Recognition logic and configuration
- Orchestration and model-routing configuration
- Memory structures and Recognition schemas
- Documentation and test suites
- Deployment configuration specific to KnoRI
- Derivative developments specifically created from Sway's ROS architecture

8.2 What Noventrix Retains

Noventrix Background IP — anything Noventrix can demonstrate was:

- Created before the engagement
- Independently developed outside the project
- Part of Noventrix's existing technology portfolio
- A generic framework, library or tool
- Generic infrastructure technology
- Generic engineering methodology
- Generic DevOps/deployment tooling
- Generic AI engineering techniques
- Generic reusable code not specifically created for Sway/KnoRI

A Background IP Schedule, itemizing the specific Noventrix tools, frameworks and libraries treated as pre-existing, will be attached as an exhibit and updated at each Phase kickoff so that “demonstrably pre-existing” is not left to be reconstructed from memory at a later dispute.

8.3 Critical Protection — Scope of “General Knowledge”

General knowledge is not defined broadly enough to allow Noventrix to claim ownership of future improvements derived specifically from working with KnoRI. The operative boundary is:

> *Noventrix retains general skills, know-how, techniques, methodologies and experience that do not embody or disclose Sway/KnoRI Confidential Information or Sway/KnoRI-owned IP.*

This is further bounded by a residuals/independent-development test: know-how qualifies only if retained in unaided memory, without reference to Sway materials, notes, or code.

8.4 Revised IP Ownership Clause — Final Contract Language

1. Sway/KnoRI Background IP. All intellectual property relating to Sway/KnoRI that existed prior to the applicable engagement, including the Recognition Operating System (“ROS”), Recognition concepts, Recognition architecture, underlying Recognition methodology, product concepts and related intellectual property supplied or introduced by Sway, shall remain the exclusive property of Sway.
2. Project-Specific Sway/KnoRI Developments. All project-specific implementations, extensions, modifications, schemas, specifications, workflows, APIs, Recognition logic, memory structures, orchestration logic, documentation and derivative developments created specifically for Sway/KnoRI or specifically derived from Sway's ROS/Recognition architecture in the performance of the Services shall, upon full payment for the applicable Phase, be owned by Sway (“Project Deliverables”).
3. Noventrix Background IP. All software, frameworks, libraries, tools, methodologies, know-how, templates, utilities, infrastructure components, technology and other intellectual property demonstrably owned or independently developed by Noventrix prior to the engagement, or developed independently of Sway/KnoRI without use of Sway Confidential Information, shall remain the exclusive property of Noventrix, as itemized in the Background IP Schedule.
4. Embedded Noventrix Background IP. Where Noventrix Background IP is incorporated into a Project Deliverable and is reasonably necessary for Sway/KnoRI to operate, maintain, modify, commercialize or further develop the applicable product independently of Noventrix, Noventrix grants Sway a perpetual, worldwide, irrevocable, royalty-free license to use, reproduce, modify and develop such embedded Background IP solely as incorporated into or required for the Sway/KnoRI product and its successor products derived from the Sway/KnoRI platform. This license is non-sublicensable and non-transferable except to a bona fide successor development provider bound by confidentiality obligations at least as protective as this Agreement.
5. General Know-How. Nothing in this Agreement prevents Noventrix from retaining and using its general technical knowledge, skills, experience, methodologies and engineering know-how acquired or improved through performance of the Services, provided such knowledge is retained in unaided memory and its use does not disclose, reproduce or exploit Sway/KnoRI Confidential Information or Sway-owned intellectual property.
6. Third-Party and Open-Source Components. Third-party software, open-source components and licensed services remain subject to their respective licenses. Noventrix shall identify material third-party dependencies incorporated into the Deliverables and shall not knowingly introduce a dependency that materially prevents Sway from independently operating and developing KnoRI without prior written approval.
7. No Vendor Ownership of ROS. For avoidance of doubt, implementation, engineering, enhancement, refactoring or further development performed by Noventrix in connection with ROS shall not, by itself, transfer ownership of ROS or project-specific Recognition architecture to Noventrix. Ownership is determined solely according to the Background IP and Project-Specific IP boundaries above.
8. Codebase Separation. Noventrix shall architecturally separate Sway-specific configuration and business logic from any Noventrix general-purpose engine code prior to each Phase 5 acceptance milestone, so that source-code delivery to Sway does not inadvertently include Noventrix's own reusable, non-project-specific platform code.
9. Trademarks. The names “KnoRI,” “Recognition Operating System,” “ROS,” and associated marks and branding created for the Sway/KnoRI product belong to Sway. This is separate from, and does not affect, ownership of the underlying technical architecture governed by clauses 1–4 above.

10. Payment Condition. Until full payment of the applicable Phase fees has been received, Noventrix retains ownership of that Phase's Project Deliverables and grants Sway the limited rights necessary for evaluation, testing and acceptance. Upon full payment, ownership transfers as stated above.

8.5 Governing Law & IP Dispute Resolution

Given that the Background IP / Project-Specific IP boundary is the most likely recurring point of friction between the parties, disputes specifically concerning IP classification under this Section 8 shall first be referred to good-faith technical mediation between each party's named technical lead before either party invokes formal dispute resolution under the Agreement's general governing law and jurisdiction clause.

9. Source-Code Access — Revised Position

The prior draft's promise of continuous repository access, deployable code and portability was inconsistent with a provision limiting Phase 5 ROS internals to compiled/interface form. That inconsistency is resolved as follows.

Deliverable	Sway-Owned Project Deliverables	Noventrix Background IP (not assigned)
Full source code	Provided to Sway/Knori	Retained by Noventrix, subject to §8.4(4) license
Repository access	Continuous, from kickoff	Not applicable
Build/deployment instructions	Provided to Sway	Interface-level only
Database schema	Provided to Sway	Not applicable
API specifications	Provided to Sway	Interface-level only
Infrastructure configuration	Provided to Sway	Not applicable
Tests & documentation	Provided to Sway	Not applicable

No compiled-only restriction applies to Sway-owned ROS or project-specific source. Noventrix's proprietary internals — where separable under clause 8 — may remain protected, subject always to the perpetual operating license Sway requires to avoid vendor dependency.

10. Portability — Strengthened Commitment

At every Phase acceptance, Sway receives:

- Current source repository
- Deployable build
- Database schema and export
- API documentation
- Environment configuration
- Infrastructure configuration (as applicable)
- Deployment documentation
- Technical architecture documentation
- Test documentation
- Third-party dependency register
- Credentials/configuration necessary for Sway-controlled infrastructure

At the conclusion of the engagement, or upon termination, Noventrix shall provide a documented, tested migration package sufficient to allow Sway or a third-party vendor to operate, maintain, and further develop KnoRI independently of Noventrix within a mutually agreed transition period not to exceed thirty (30) days from request.

11. Commercial Structure

11.1 Contract 1 — Phase 1 (Fixed-Scope Development Engagement)

The contract should contain:

- Phase 1 scope & deliverables
- Timeline & acceptance criteria
- Exclusions & dependencies
- IP ownership (Section 8, above)
- Source-code access (Section 9)
- Third-party dependencies
- Hosting responsibility
- Documentation
- Warranty & AMC
- Change Request definition
- Portability (Section 10)

11.2 Roadmap Agreement — Phases 2–5

The roadmap is presented now, but Noventrix is not locked into fixed future pricing/scope until the preceding phase produces validated learnings. This protects both parties: Phase 2 will tell us what Recognition actually requires after Phase 1 data exists. Future scope and pricing for each subsequent phase is separately approved before commencement.

11.3 The Critical Scope Rule

> *A capability required to satisfy an agreed Phase acceptance criterion is included in the Phase scope. A genuinely new capability, requirement or direction introduced after scope approval is handled through Change Request.*

Sway has stated that implementation difficulty should not be used to convert an agreed acceptance criterion into a Change Request. Noventrix, in turn, must be protected from scope expansion disguised as clarification. This rule is retained unchanged.

12. Strategic Positioning

Noventrix is not acquiring ROS. Noventrix is engineering ROS with Sway.

Sway owns the Recognition IP and the platform being built. Noventrix owns its own technology and engineering assets. The commercial objective is to build KnoRI into a genuine Recognition platform without either party creating unintended IP transfer or vendor dependency.

12.1 Final Product Architecture

Sway's/Knori's ROS / Recognition IP is the architectural root of the platform. Recognition Intelligence and Longitudinal Memory converge into Relationship Intelligence, which sits above Context Intelligence, AI Orchestration and Model Abstraction — the common foundation from which KnoRI, and any future Sway products, are built.

> *Signal → Evidence → Context → Interpretation → Confidence → Threshold → Recognition → Provenance → Correction → Evolving Understanding*

This loop is the architectural spine of the entire proposal and, per Section 8, is Sway-owned Recognition architecture engineered by Noventrix on Sway's behalf.

13. Closing

This revised proposal is submitted for Sway's review and countersignature. Upon agreement, Section 8 (Intellectual Property), Section 9 (Source-Code Access) and Section 10 (Portability) will be incorporated as the governing terms of the Phase 1 Development Agreement referenced in Section 11.1.

Regards,

Md. Towheduzzaman Anik
CEO & Founder, Noventrix Solutions
